

COOLER SHOCK[®] Hard Pack

INSTRUCTIONS FOR SETUP AND USE

Remove cap, squeeze the provided funnel into the opening. Funnel will kink slightly which helps let air out of pack. Slowly add 7 cups of tap water (56oz).

Squeeze pack slowly until water reaches the top of the spout. Laying the pack against the sink edge and pressing works well.

Screw cap on tight while water is visible at the top. This is a child safety cap. It is intentionally difficult to remove, but can be done by an adult if you discover that you left some air in the pack.

Here is a side view of the pack to help you understand its final intended shape. If you leave air in the pack or if you added too much water, it will be wider in the center than the top and bottom. If it is wider, squeeze out air or water until the center is narrow just like the top and bottom. The handle is a good reference for proper width of the center.

Now shake in several directions for a minute. This really helps the pack to be fully blended and gives the best results. Re-check cap for tightness and place in the freezer. It's a best practice to freeze the pack for 48 hours when it is starting out at room temperature. This gives you the best results.
